

Web API Design with Spring Boot Week 15 Coding Assignment

Points possible: 75

URL to GitHub Repository: <https://github.com/Xelyen/Week-15/tree/main/jeep-sales>

URL to Public Link of your Video: <https://youtu.be/nC8p-a2MKrw>

Instructions :

1. Follow the **Coding Steps** below to complete this assignment.

- In Spring Tool Suite (STS), or an IDE of your choice, write the code that accomplishes the objectives listed below. Ensure that the code compiles and runs as directed.
- Use your existing repo or create a new repository on GitHub for this week's assignment and push your completed code to the repo, including your entire Maven Project Directory (e.g., jeep-sales) and any additional files (e.g. .sql files) that you create. In addition, screenshot your ERD and push the screenshot to your GitHub repo.
- Include the screenshots into this Assignment Document indicated by: 
- Create a video showcasing your work:
 - In this video: record and present your project verbally while showing the results of the working project.
 - Easy way to Create a video: Start a meeting in Zoom, share your screen, open Eclipse with the code and your Console window, start recording & record yourself describing and running the program showing the results.
 - Your video should be a maximum of 5 minutes.
 - Upload your video with a public link.
 - Easy way to Create a Public Video Link: Upload your video recording to YouTube with a public link.

2. In addition, please include the following in your Coding Assignment Document:

- The requested screenshots, indicated by: 
- The URL for this week's GitHub repository.
- The URL of the public link of your video.

3. Save the Coding Assignment Document as a .pdf and do the following:

- Push the .pdf to the GitHub repo for this week.
 - Upload the .pdf to the LMS in your Coding Assignment Submission.
-

Web API Design with Spring Boot Week 15 Coding Assignment

Here's a friendly tip: as you watch the videos, code along with the videos. This will help you with the homework. When a screenshot is required, look for the icon:  You will keep adding to this project throughout this part of the course. When it comes time for the final project, use this project as a starter.

Project Resources: <https://github.com/promineotech/Spring-Boot-Course-Student-Resources>

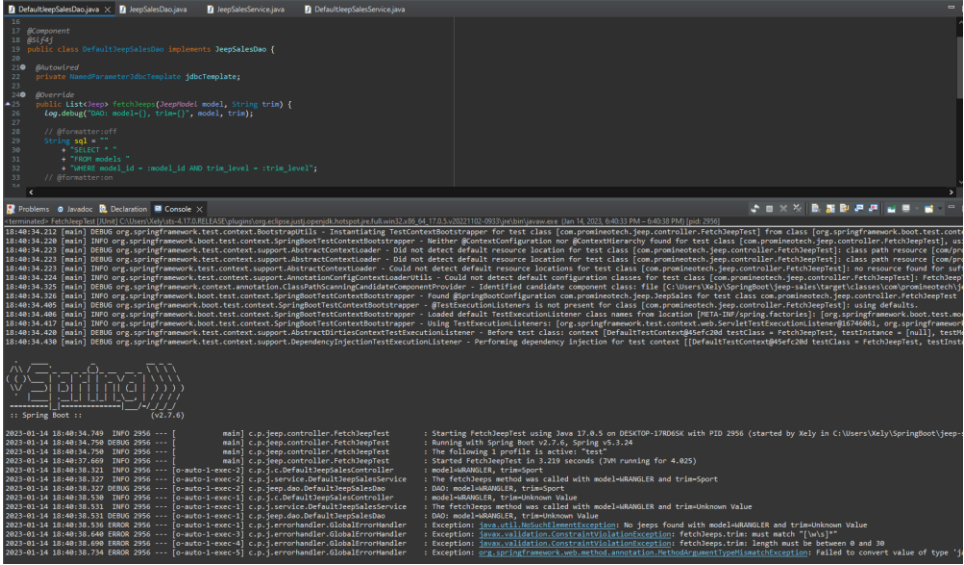

Coding Steps:

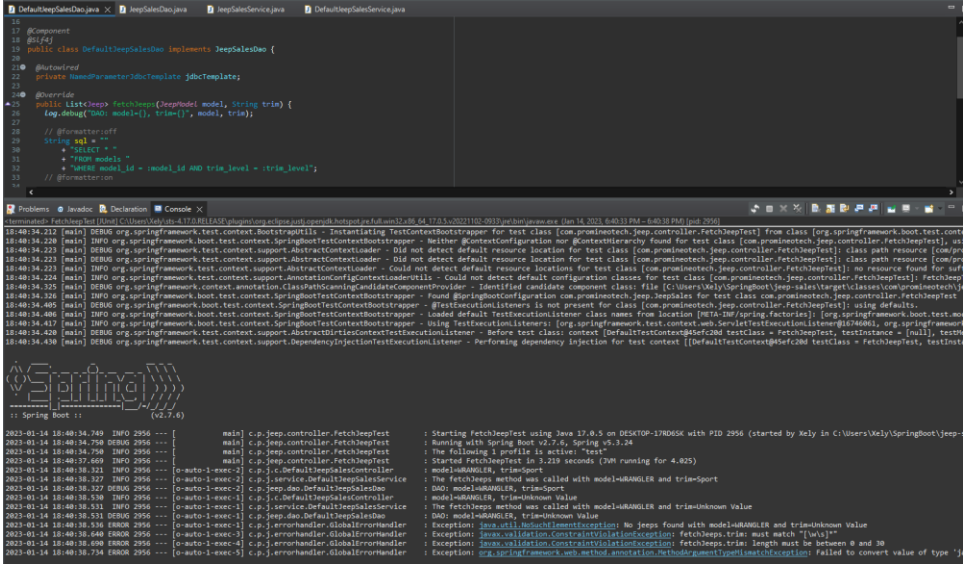

- 1) In the application you've been building add a DAO layer:
 - a) Add the package, com.promineotech.jeepp.dao.
 - b) In the new package, create an interface named JeepSalesDao.
 - c) In the same package, create a class named DefaultJeepSalesDao that implements JeepSalesDao.
 - d) Add a method in the DAO interface and implementation that returns a list of Jeep models (class Jeep) and takes the model and trim parameters. Here is the method signature:

```
List<Jeep> fetchJeeps(JeepModel model, String trim);
```
- 2) In the Jeep sales service implementation class, inject the DAO interface as an instance variable. The instance variable should be private and should be named jeepSalesDao. Call the DAO method from the service method and store the returned value in a local variable named jeeps. Return the value in the jeeps variable (we will add to this later).

Web API Design with Spring Boot Week 15 Coding Assignment

3) In the DAO implementation class (DefaultJeepSalesDao):

- Add the class-level annotation: `@Service`.
- Add a log statement in `DefaultJeepSalesDao.fetchJeeps()` that logs the model and trim level. Run the integration test. Produce a screenshot showing the DAO implementation class and the log line in the IDE's console. 

The screenshot shows the IDE with the `DefaultJeepSalesDao` class open. The class is annotated with `@Service` and has a `fetchJeeps` method that logs the model and trim level. The console output shows the Spring Boot application running and the `fetchJeeps` method being called, with the log line `log.debug("Model: {}, Trim: {}", model, trim);` visible.

- In `DefaultJeepSalesDao`, inject an instance variable of type `NamedParameterJdbcTemplate`.
- Write SQL to return a list of Jeep models based on the parameters: model and trim. Be sure to utilize the SQL Injection prevention mechanism of the `NamedParameterJdbcTemplate` using `:model_id` and `:trim_level` in the query.
- Add the parameters to a parameter map as shown in the video. Don't forget to convert the `JeepModel` enum value to a String (i.e., `params.put("model_id", model.toString());`)
- Call the query method on the `NamedParameterJdbcTemplate` instance variable to return a list of Jeep model objects. Use a `RowMapper` to map each row of the result set. Remember to convert `modelId` to a `JeepModel`. See the video for details. Produce a screenshot to show the complete method in the implementation class. 

DefaultJeepSalesDao.java × JeepSalesDao.java JeepSalesService.java DefaultJeepSalesService.java Jeep.java
